

DEHIX LiveRoom

Google for Startups Phase 2 Submission Pack

Video learnings, implementation opportunities, and form-ready draft answers for the DEHIX LiveRoom project.

CURRENT PRODUCT

AI-powered Web3 hiring room

BEST GOOGLE AI ANGLE

Gemini + ADK agent workflow

CRITICAL FORM RISK

Live public URL required

IMPORTANT SUBMISSION NOTE

The local repo currently documents Azure OpenAI as the active AI provider. Use the form answers below after deploying a Gemini-powered version, or clearly disclose the current provider. The Google Form requires a live public URL; local-only, GitHub-only, Loom-only, and mock deployments are disqualification risks.

LEARNING SYNTHESIS

What The Videos Teach

Video 1 - Prototyping with Google AI Studio and Antigravity - Use Think, Build, Publish as a startup sprint. - Treat speed as the early-stage advantage. - Give Gemini a strong role, goal, context, desired output, and constraints. - Use AI Studio for prompt experiments and live app previews. - Use Antigravity for repo-level implementation, design-to-code, MCP integrations, and versioned iteration. - Publish the prototype to a real public cloud URL.	How it maps to DEHIX - Turn the existing launch wizard into a Google AI Studio-tested prompt workflow. - Use Antigravity-style repo context to improve CreateRoom, LiveRoom, AI routes, and document generation together. - Use MCP/tool integrations for GitHub tickets, Google Drive docs, Calendar/Meet, and database access. - Prioritize deployable prototype proof over extra mock screens.
Video 2 - Building Agents with Gemini and ADK - Static AI apps are not enough; agents should plan, keep memory, manage state, and execute workflows. - ADK supports single and multi-agent systems with root/subagents, sequential, loop, and parallel patterns. - Agent Runtime, Cloud Run, sessions, memory, identity, policies, observability, and evals matter for production. - Tools and MCP/A2A style collaboration help agents interact with data, systems, and other agents safely.	How it maps to DEHIX - Model the current launch-to-room flow as an ADK agent system. - Add specialized agents for business validation, technical blueprinting, talent matching, document drafting, and QA review. - Use stored launch sessions and room chat as memory. - Add least-privilege tools for creating tickets, milestones, NDAs, and talent recommendations.

CORE TAKEAWAY

For DEHIX, the strongest story is not just 'AI chat'. It is an agentic launch-to-delivery workspace: a founder describes an idea, Gemini validates it, ADK-style agents convert it into a scoped build plan, verified talent is matched, and the live room keeps execution moving with tickets, milestones, documents, NDA, and contextual chat.

DEHIX BUILD PLAN

Implementation Opportunities

Priority	Build in DEHIX LiveRoom	Why it matters
P0 - Submission	Add a Gemini API client beside or in place of the Azure OpenAI client. Wire Gemini JSON outputs into business validation, blueprint, scope, chat, ticket, milestone, NDA, and document routes. Deploy frontend and API to a public HTTPS URL.	The form specifically asks for a live Google AI integration. This converts the current AI workflow into a Google AI prototype and gives reviewers a working URL.
P0 - Prompt discipline	Reuse the video 1 pattern: role, goal, context, constraints, and exact output schema. Add model response validation, repair retry, and backend scoring for repeatability.	It makes generated business reports, roles, budgets, and tickets more consistent and submission-safe.
P1 - ADK orchestration	Create a root Launch Orchestrator with subagents: Business Analyst, Solution Architect, Talent Matcher, Document Drafter, Room Ops, and Critic/QA.	It upgrades DEHIX from prompt calls to a defensible multi-step agent workflow.
P1 - Memory and tools	Use LaunchSession, LiveRoom, AiChatMessage, Ticket, Milestone, Nda, and SbtCredential records as agent memory/tools. Add read-only and write tools with scoped permissions.	The agent can act on real room state without unsafe broad database access.
P2 - Google Cloud scale	Move API/agent workloads to Cloud Run or Agent Runtime, secrets to Secret Manager, logs/traces to Cloud Monitoring, docs/assets to Cloud Storage, and analytics to BigQuery.	This prepares the prototype for production reliability, cost control, and Phase 2 architecture discussions.

SUBMISSION NARRATIVE

Recommended Google AI Architecture

TARGET ARCHITECTURE

React/Vite frontend on Firebase Hosting or Cloud Run calls the Express API on Cloud Run. The API calls Gemini directly for quick structured generation and calls an ADK agent service for multi-step launch workflows. Agents use tools for MongoDB/Firestore, tickets, milestones, NDAs, credentials, PDFs, Google Drive, GitHub, Calendar/Meet, and future vector search.

Existing DEHIX modules	Google AI upgrade
- CreateRoom launch intake - Business validation report - Technical questionnaire - Business/development blueprint - Talent recommendations - LiveRoom chat - Tickets and milestones - NDA generation/signing - Activity logs and generated documents	- Gemini API for structured reasoning - AI Studio for prompt testing - Antigravity for repo-level implementation - ADK agent service for orchestration - Agent memory from launch/session/chat state - Tool scopes for database writes - Critic loop for blueprint/ticket quality - Cloud Run deployment with observability

Agent skill map

Priority	Build in DEHIX LiveRoom	Why it matters
Business Analyst	Reads raw idea and region; returns market demand, audience, competitors, revenue logic, risks, SWOT, and score dimensions.	Supports the current Phase 1 validation flow.
Solution Architect	Reads validation plus technical answers; creates stack, system components, API modules, database entities, roadmap, and budget.	Supports the current blueprint and room creation flow.
Talent Matcher	Reads recommended roles, budget, and SBT-style credentials; ranks candidates by skill fit, reputation, GitHub score, experience, budget, and availability.	Turns DEHIX credibility data into the project's moat.
Document Drafter	Generates pitch decks, technical decks, SOW, PRD, MVP scope, architecture docs, NDA drafts, and chat summaries.	Expands the existing document generation feature.
Critic/QA	Runs a loop over generated blueprints, tickets, milestones, and docs; checks missing fields, vague tasks, inconsistent budgets, and unsafe claims.	Uses the ADK loop-agent lesson to improve reliability.

GOOGLE FORM DRAFT

Form-Ready Answers

HOW TO USE THIS SECTION

Paste these answers into the form after replacing placeholders in angle brackets. Answers intentionally distinguish current implementation from the Google AI deployment target where needed.

FORM ANSWER**Full Name ***

<Your full name>

Note: Replace before submitting.

FORM ANSWER**Immersion Registered Email ID ***

<Your Phase 1 registered email ID>

Note: Use the same email used for Phase 1 registration.

FORM ANSWER**Contact Number ***

<Your contact number with country code>

Note: Replace before submitting.

FORM ANSWER**Startup Name ***

DEHIX

FORM ANSWER**The Integration: Briefly describe the AI solution or feature you have built and deployed. (Focus on the specific business problem this solves and the core logic behind it.) ***

DEHIX LiveRoom is an AI-powered launch-to-delivery workspace for Web3 hiring and project execution. The Google AI integration turns a founder's raw business idea into a structured execution room: Gemini validates the idea, asks practical technical intake questions, generates a business and development blueprint, recommends verified talent from SBT-style credential data, creates milestones and tickets, drafts NDAs and project documents, and powers a context-aware room copilot. This solves the slow and trust-heavy process of scoping Web3 work, finding credible builders, and converting early business ideas into an actionable build plan. The core logic is a deterministic multi-step workflow that can be upgraded into ADK agents: business validation, technical scoping, talent matching, document drafting, and room operations, each grounded in saved launch/session/room data.

Note: Use this after the Gemini version is live.

FORM ANSWER

Proof of Execution (Live URL): Provide the public URL of your working prototype / deployment. Must be a live URL; alternative formats will not be considered. *

<Insert live public HTTPS deployment URL, for example a Cloud Run or Firebase Hosting URL. Do not submit localhost, GitHub repository, Loom, Figma, or mockup links.>

Note: This is the most important missing field.

FORM ANSWER

Which Google AI models did your prototype primarily utilize? *

Select: Gemini API. Optional only if implemented before submission: Imagen for generated room/project visuals or credential badge artwork. Do not select Gemma unless a Gemma-based local or open-weight classifier is actually running in the prototype.

FORM ANSWER

Which development environments/tools did you use to build the prototype / deployment? *

Select: Google AI Studio and Google Antigravity. Add 'Other' only if the form allows details: React, Vite, Express, MongoDB/Mongoose, Firebase, Socket.io, and Google Cloud deployment tooling. If the ADK version is deployed, include Gemini Enterprise Agent Platform / Agent Development Kit as the agent orchestration layer.

FORM ANSWER**Current Infrastructure Footprint: Which primary cloud service provider(s) currently host your core workloads, and what is your estimated monthly cloud expenditure? ***

Current prototype footprint: local development / early prototype with MongoDB and Firebase-ready configuration. Recommended submission footprint: Google Cloud, with frontend on Firebase Hosting or Cloud Run, API on Cloud Run, secrets in Secret Manager, logs in Cloud Logging/Monitoring, and MongoDB Atlas or Firestore for persistence. Estimated MVP-stage cloud spend: USD 0-100/month depending on traffic, Gemini usage, database tier, and whether the agent runtime is always-on or serverless.

Note: Replace with actual spend/provider if already deployed.

FORM ANSWER**The Architecture: Beyond the core AI model, which broader infrastructure services (e.g., Cloud Run, Vector DBs, BigQuery, Supabase) are powering this deployment? ***

The target deployment uses Cloud Run for the Express API and ADK/Gemini agent service, Firebase Hosting for the React/Vite frontend, Firebase/Firestore for real-time live room chat or notifications, MongoDB Atlas or Firestore for launch sessions, users, rooms, credentials, tickets, milestones, NDAs, and AI chat history, Secret Manager for API keys and service credentials, Cloud Storage for generated PDFs/documents and future assets, Cloud Logging/Monitoring for production traces, and optional BigQuery plus Vertex AI Vector Search for analytics and retrieval over historical rooms, generated documents, and knowledge base material.

FORM ANSWER**Agentic Complexity: Does this prototype utilize multi-step agentic workflows? If so, briefly describe the 'skills' or tools your agent orchestrates. ***

Yes. The DEHIX workflow is multi-step: it starts with business idea validation, moves into technical scoping, generates a blueprint, recommends talent, creates a live room, and then supports tickets, milestones, NDA, project documents, and contextual chat. The ADK-oriented design has a root Launch Orchestrator that delegates to specialized skills: Business Analyst, Solution Architect, Talent Matcher, Document Drafter, Room Operations, and Critic/QA. Tools include reading/writing launch sessions, rooms, credentials, tickets, milestones, NDAs, chat history, and generated documents. The Critic/QA loop checks for vague tickets, inconsistent budgets, missing fields, and unsafe or unsupported claims before final output is shown.

Note: If ADK is not deployed yet, phrase as 'deterministic multi-step workflow, being upgraded to ADK agents'.

FORM ANSWER**Google Ecosystem: Beyond the AI Studio and models utilized in this specific sprint, which broader Google Cloud products, databases, or APIs are you currently using, or actively planning to integrate into your stack over the next 3-6 months? ***

Planned 3-6 month Google stack: Cloud Run for API and agent workloads, Firebase Hosting/Auth/Firestore for web delivery, authentication, and live room state, Gemini Enterprise Agent Platform / ADK for multi-agent workflows, Vertex AI Vector Search for retrieval over past projects and generated documents, BigQuery for marketplace analytics and funnel metrics, Cloud Storage for PDFs and generated assets, Secret Manager for credentials, Cloud Build/Cloud Deploy for CI/CD, Cloud Logging/Monitoring for observability, and Google Calendar/Meet APIs for scheduling and live-room collaboration.

FORM ANSWER

Your Primary Goal for Phase 2: If selected for the in-person residency, what is the single most critical outcome you are looking to drive for your startup? *

Select: Deep-dive architecture whiteboarding and live bug-squashing with Google Cloud Engineers to scale our infrastructure reliably. Rationale: DEHIX already has a working full-stack product shape; the highest-leverage outcome is converting the current prototype into a reliable Google Cloud and Gemini/ADK architecture with clean deployment, observability, security boundaries, and predictable unit economics.

FORM ANSWER

Startup Momentum: Please drop links to any recent company milestones, press releases, funding announcements, or technical accolades that highlight your startup's current market traction.

<Add relevant links: live product URL, company website, public demo page, product milestone post, pitch/demo deck link, customer/pilot proof, hackathon or accelerator selection, press mention, or technical write-up. If nothing public exists yet, write: 'Prototype milestone: DEHIX LiveRoom now supports AI idea validation, technical blueprint generation, talent matching, live room collaboration, tickets, milestones, NDA generation, document generation, and PDF exports. Public links will be added as they go live.'>

Note: Replace with real links if available.

FORM ANSWER

Feedback: Is there anything else you wish to convey? Please share any brief product feedback on Google AI Studio, Antigravity, or the core models to help our engineering teams improve.

Google AI Studio was most useful for rapidly testing prompts and understanding how a raw idea can become a working prototype quickly. Antigravity's repo-aware and MCP-oriented workflow maps well to a product like DEHIX because the AI needs project context, code context, and external tools together. For improvement, we would value more TypeScript/Node-first ADK examples, clearer migration paths from AI Studio prototypes into existing React/Express monorepos, stronger examples for structured JSON/schema outputs, and easier cost/latency visibility for multi-agent workflows in early-stage startup deployments.

FORM ANSWER

Phase 2 Commitment: I acknowledge that the Phase 2 Offline Immersion is an in-person residency held on June 26 at the Google Ananta office in Bengaluru. If selected, I confirm that I will manage my own travel, commute, and accommodation logistics. *

Select: Yes.

Note: Only select Yes if you can attend in person.

CHECKLIST

Before Submitting

Priority	Build in DEHIX LiveRoom	Why it matters
Must fix	Deploy a live public URL. The form explicitly rejects local-only, GitHub-only, Loom, Figma, wireframe, or mockup submissions.	Without this, the submission can be disqualified even if the PDF answers are strong.
Must verify	Make sure the deployed prototype actually uses Gemini API or a Google AI service for the submitted AI feature.	The repo currently documents Azure OpenAI; the form is for Google's AI suite.
Must replace	Fill in full name, registered email, contact number, live URL, real infrastructure spend, and real momentum links.	These are personal/company facts not available from the local repo.
Should add	Add a small in-app 'Powered by Gemini' proof point in the AI workflow and log AI provider/model in backend health or admin output.	This makes the integration obvious to reviewers.
Should prepare	Keep a short demo path: login, create launch idea, view validation, answer technical questions, generate blueprint, match talent, enter live room, ask AI, download PDF/document.	Reviewers can quickly see end-to-end execution.

RECOMMENDED ONE-LINE SUBMISSION STORY

DEHIX LiveRoom uses Gemini to transform a startup idea into an execution-ready Web3 build room with validation, blueprinting, talent matching, milestone planning, documents, and an agentic project copilot.
